

Build a mini ATS (Applicant Tracking System) that can be live in the hands of a first customer as quickly as possible.

Core features:

- As an admin, I can create accounts (both admin accounts and customer accounts).
- As a customer, I can log in.
- As a customer, I can post jobs I'm recruiting for.
- As a customer, I can add candidates with their profile information (for example, a LinkedIn link).
- As a customer, I can see a compact Kanban view with all candidates associated with my jobs.
- As a customer, I can filter the Kanban view by job and candidate name.
- As an admin, I can do everything a customer can do on their behalf.

Guidelines:

- Use Supabase as the backend (for example, authentication and database).
- Use AI tools as much as possible to build quickly (for example, Lovable, Cursor, Claude Code, Codex, Copilot).
- Feel free to make reasonable assumptions about customers, preferences, needs, etc.
- If you have time, feel free to add functionality you consider relevant for an ATS.

Delivery:

- Share admin login access to the platform with me (including the live URL).
- Record a 5 minute demo video using Loom (or a similar tool) and share it with me.
- Email me any assumptions you made.
- Share the link to the repo.
- Feel free to ship often (you can deliver multiple times if you want).

Extra task (AI feature):

- Implement a simple/stripped-down function for AI-based assessment of a candidate's CV.
- At minimum: explain in your demo how you would approach such a problem.

Deadline: 1 week (so by 22 September).
